Published articles and reports were used to estimate the survival rates of the disease at each age. The costs of rheumatic diseases in Japan were calculated by multiplying the estimated survival rates of RA by the estimated average annual direct and indirect cost of RA in Japan. The mean survival rate at each age was 4.9 years. The mean cost of RA in 1998 in Japan was 1.44 million yen, which corresponds to the direct cost of 0.98 million yen.
